Winter term 2023/24, to be discussed on November 14, 2023

# Harmonic Analysis Homework Sheet 2

#### Exercise 2.1

Let  $\hat{f}(\xi) := \int_{\mathbb{R}^d} e^{2\pi i x \cdot \xi} f(x) dx$  denote the Fourier transform which is well-defined on  $L^1(\mathbb{R}^d)$ or the Schwartz space  $\mathcal{S}(\mathbb{R}^d)$  and then extended to  $L^p(\mathbb{R}^d)$  for any  $1 \leq p \leq 2$  by Plancherel (initially on  $L^1 \cap L^2$  and then extended via density to  $L^2$ ) and interpolation. Recall that the interpolation lead us to the (non-optimal) Hausdorff–Young inequality

$$\|f\|_{L^{p'}(\mathbb{R}^d)} \le \|f\|_{L^p(\mathbb{R}^d)}.$$

Suppose there was an inequality of the form

 $\|\hat{f}\|_{L^{q}(\mathbb{R}^{d})} \leq C_{p,q,d} \|f\|_{L^{p}(\mathbb{R}^{d})}$ 

for some  $1 \le p, q \le \infty$ . Show (by a scaling argument) that necessarily q = p' and, by randomizing a sequence of functions and Khintchine's inequality, that  $p \le 2$ .

## Exercise 2.2

Let f, g be measurable on a  $\sigma$ -finite measure space  $(X, \mu)$ . Prove the Hardy–Littlewood inequality

$$\int_{X} |f(x)g(x)| \, d\mu(x) \le \int_{0}^{\infty} f^{*}(t)g^{*}(t) \, dt,$$

where  $f^*, g^*$  are the decreasing rearrangements of f and g, respectively.

#### Exercise 2.3

Show the following

**Lemma 0.1.** Let  $(X, \|\cdot\|)$  be a quasi-normed space, i.e.,  $\|f+g\| \leq c_1(\|f\|+\|g\|)$  for some  $c_1 \geq 1$ . Assume that a sequence  $(f_k)_{k\in\mathbb{N}} \in X$  satisfies  $\|f_k\| \leq A \cdot c_2^{-k}$  for some A > 0 and  $c_2 > 1$ . Then  $\|\sum_{k=1}^N f_k\| \leq A \cdot c_3$  where  $c_3$  does not depend on A or N (but possibly on  $c_1$  and  $c_2$ ).

(Why is this assertion non-trivial?)

#### Exercise 2.4 (optional)

Establish the upper bound " $\leq_{p,q}$ " in Proposition 1.2.18 for  $q < \infty$ . (Instruction/Hints: Make use of (i) $\Rightarrow$ (ii) of Theorem 1.2.14 to decompose  $f = \sum_m f_m$  where  $f_m$  are quasi-step functions of height  $2^m$  and width  $W_m$  so that the sequence  $a_m := 2^m W_m^{1/p}$  has  $\ell_m^q$  norm  $\sim_{p,q} 1$ . Then make an ansatz for g such as  $g := \sum_m g_m$  where  $g_m := a_m^r |f_m|^{p-2} \overline{f_m}$  with r = q - p (or  $r = (q - p)_+$ ) and show that  $|\int_X fg| \sim_{p,q} 1$ . Thus, you have reduced the claim to showing  $||\sum_m g_m||_{p',q'} \leq_{p,q} 1$ which you may want to show using (iii) $\Rightarrow$ (i) of Theorem 1.2.14. First of all, convince yourself that  $g_m \leq_{p,q} a_m^r 2^{m(p-1)} \mathbf{1}_{E_m}$  where  $E_m = \text{supp } f_m$  satisfies  $\mu(E_m) \leq_{p,q} W_m = 2^{-mp} a_m^p$  with the above  $a_m$ . To remedy for the fact that the sequence of heights of  $g_m$  is not lacunary (at least a priori), you can introduce modified heights  $H_m := \sup_{k\geq 0} a_{m-k}^r 2^{m(p-1)} 2^{-k(p-1)/2}$ . (Clearly, the old weights are recovered for k = 0.) Having checked that  $H_{m+1} \geq 2^{(p-1)/2} H_m$  (i.e., they increase geometrically), we see that it would suffice to check  $\|\sum_m H_m \mathbf{1}_{E_m}\|_{p',q'} \lesssim_{p,q} 1$ . But now, we're in position to apply (iii) $\Rightarrow$ (i), i.e., you are left to check  $\|H_m \mu(E_m)^{1/p'}\|_{\ell_m^{q'}} \lesssim_{p,q} 1$ .)

### Exercise 2.5 (optional)

Let  $0 , <math>1 < q \le \infty$  and assume  $(X, \mu)$  and  $(Y, \nu)$  are two measure spaces. Let T be a sublinear operator (initially defined on the set of really simple functions  $f = \sum_{k=1}^{N} a_k \mathbf{1}_{E_k}$  on X such that Tf is a  $\nu$ -measurable function on Y), i.e.,  $|T(f+g)| \le |Tf| + |Tg|$  and  $|T(\lambda f)| = |\lambda||Tf|$  for  $f, g \in \text{dom}(T)$  and  $\lambda \in \mathbb{C}$ . We say that T is of restricted weak type (p, q) if

 $\alpha d_{T\mathbf{1}_E}(\alpha)^{1/q} \lesssim |E|^{1/p} \text{ for all } \alpha > 0, E \subseteq X.$ 

Prove that T is of restricted weak type (p,q) if and only if

$$\left|\int_{F} (T\mathbf{1}_{E})(x) \, d\nu(x)\right| =: \left|\langle \mathbf{1}_{F}, T\mathbf{1}_{E} \rangle\right| \lesssim |E|^{1/p} |F|^{1/q'}$$

for all  $E \subseteq X$  and  $F \subseteq Y$ . (Hint: Use Proposition 1.2.18 for " $\Leftarrow$ " and Hölder's inequality or the layer-cake representation and Fubini to prove " $\Rightarrow$ ".)
